ABSTRACT OF THE DISCLOSURE

In order to enable mounting of a cabinet having a display unit to a supporting base, axial members in the shape of a regular polygonal prism are disposed in the cabinet 1 and fitting holes into which the regular polygonal prisms can be fitted, respectively, are disposed in the supporting base. By opening and then closing, or opening and then moving the axial members, the user can fit or remove them into or from the fitting holes, respectively, so as to mount or demount the cabinet to or from the supporting base. By tilting the cabinet by an angle when fitting the axial members into the fitting holes, respectively, the user can change the rotational attitude of the cabinet with respect to the supporting base. Thereby, the user can use the display unit at different times and at different positions with simple manipulations.
